

Remittance Responses to Temporary Discounts: A Field Experiment among Central American Migrants

Diego Aycinena, Universidad Francisco Marroquín

Kate Ambler, IFPRI

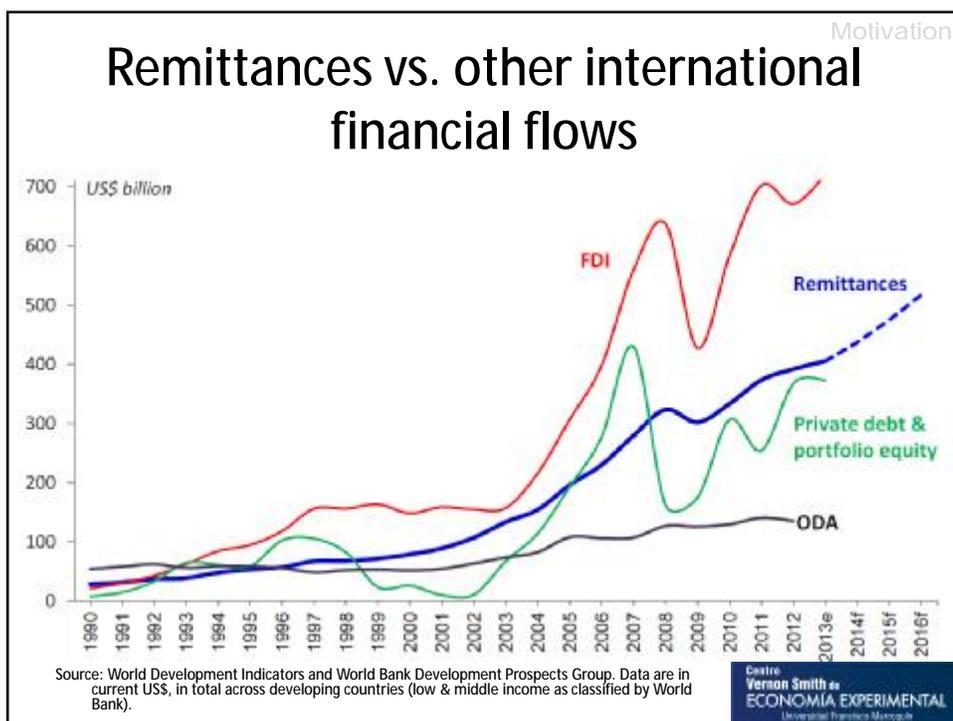

Dean Yang, University of Michigan

Seminario de Investigadores Económicos de Guatemala,
Banco de Guatemala, 30 de octubre de 2014

Motivation

Motivating Ideas

- Migrant remittances are a huge and growing international financial flow to developing countries
 - over \$404 billion sent to developing countries in 2013

Motivation

Motivating Ideas

- Migrant remittances are a huge and growing international financial flow to developing countries
 - over \$404 billion sent to developing countries in 2013
- Many studies document associations with or causal impacts on important development indicators
 - Health, education, housing, poverty, entrepreneurship, responses to shocks, etc.
- Great deal of interest among policymakers and development agencies in policy options for leveraging remittances for development goals

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Politècnica de Catalunya

Motivation

Motivating Ideas: Remittance policy approaches

- Enhance financial literacy in transnational households
 - Doi, McKenzie and Zia (2012)
 - Seshan and Yang (2013)
- Enhance migrant control over remittance uses
 - Ashraf, Aycinena, Martinez, and Yang (2012)
 - Ambler, Aycinena, and Yang (2014)
 - De Arcangelis, Joxhe, McKenzie, Tiongson, and Yang (2014)
- Reduce communication costs (Batista and Narciso 2013)

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

Motivation

Motivating Ideas

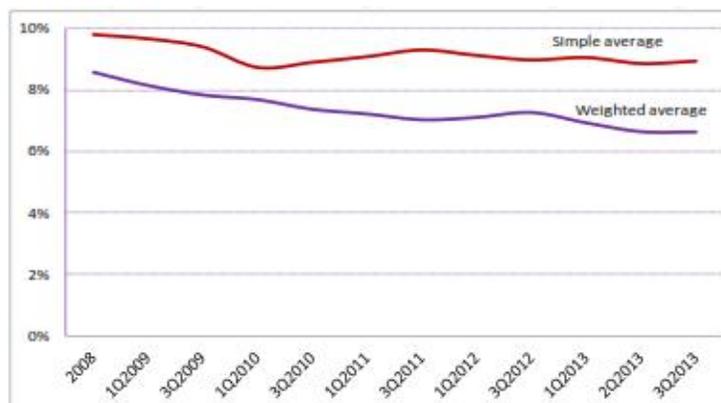

- But we are just starting to learn about the micro-economics behind remittances
 - We still know very little about what determines migrants' remittance-sending decisions
- In particular: little evidence on impact of remittance fees (on frequency or total amounts)
 - Typical fee structure: migrant pays a fixed fee for a remittance of up to a certain ceiling

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

Motivation

Remittances Fees (2008-2013)

Total cost of sending US\$200 (including fees and exchange rate margins)

Source: World Bank, Remittance prices worldwide (Migration Development Brief 21, October 2013).

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

Motivation

Motivating Ideas

- But we are just starting to learn about the micro-economics behind remittances
 - We still know very little about what determines migrants' remittance-sending decisions
- In particular: little evidence on impact of remittance fees (on frequency or total amounts)
 - Typical fee structure: migrant pays a fixed fee for a remittance of up to a certain ceiling
 - How responsive is migrant remittance-sending behavior to price?
 - Is prospect theory relevant for understanding migrant remittance flows?

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

Motivation

Motivating Ideas: Prospect Theory

- Prospect theory (Kahneman and Tversky 1979, 1991) has been used to explain departures from expected utility framework in and out of the lab settings
- One observation: remittances are much less volatile than other international financial flows
 - Prospect theory provides an explanation: remittance recipients are loss-averse, so migrants try to keep remittances constant, even in the face of shocks
- Certain patterns of responses to temporary price discounts are consistent with prospect theory

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

Motivation

Remittance Fees & Flows Literature

- Freund and Spatafora (2006)
 - Cross-country data to show that remittance fees are negatively correlated with total remittances at the country level.
- Gibson, McKenzie, and Rohorua (2006)
 - Migrants report that they would send more in remittances if fees were lowered (hypothetical survey question)
- Aycinena, Martinez, and Yang (2010)
 - Field experiment randomly assigning discounted prices for remittances with a particular MTO.
 - A \$1 reduction in the price of a remittance leads to a \$25 monthly increase in remittance payments.

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

Motivation

Aycinena, Martinez, and Yang (2010)

- Field experiment that randomized remittance fees among migrants from El Salvador in the Washington, DC area
- Advantages of combining administrative and survey data:
 - Admin data from partner limits problems of measurement error
 - Survey of migrants allow to assess extent of switching from other remittance channels
- Limitations:
 - Most participants were not baseline customers of the partner institution, limiting the ability to observe full remittance behavior and raising concerns that the effects might be driven by switching remittance companies or sending remittances for others.
 - Data is not available for the period after the discounts expired, so the authors cannot observe long term trends in remittance behavior.

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

Motivation

AMY (2010) Experimental Design

- Randomly allocated 1,400 Salvadoran migrants in Washington, D.C. to different remittance transaction fees
 - 50% probability of \$9 fee
 - 10% probability for each of: \$8, \$7, \$6, \$5, \$4
- Discount offered via a partner money transmission institution with 11 physical branches in DC area (and 64 bank branches in El Salvador)
 - Fee is for remittance of any size up to \$1,500

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

The Experiment

Our Contribution

- We partner with money transfer company Viamericas
 - Generate sample of Washington, DC metro area migrants who send remittances to Guatemala or El Salvador
- Randomize the offer of a limited-time (10 week) discount on remittance fee
 - Randomization allows for causal identification of impacts
- Examine impacts on remittances during and after discount period using administrative and survey data

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

The Experiment

Advantages of our design

- Unique combination of administrative and survey data
- Admin data from partner institution limits problems of measurement error
 - We rely on existing customers to minimize switching from other remittance channels to be driving the effects
 - Pre-, during- and post- intervention admin data allow us to examine inter-temporal substitutions
- Survey data complements administrative data
 - Endline survey of migrants allows us to ask whether they are sending for third parties
- Discount is for PRR, to limit sending on behalf of others

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

The Experiment

Our Results: Preview

- We find increases in number of transactions and total amount sent
 - During discount period...
 - and up to 20 weeks after
- Not consistent with standard economic model
- Consistent with remittance recipients having reference-dependent preferences, which migrants don't fully anticipate
 - Behavioral biases may be important determinants of international remittance flows

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

The Experiment

Research Partner: Viamericas

- Money transfer company with headquarters in Bethesda, MD
- Vast majority of business occurs in person through independent agents in US
- Viamericas fees to Central America: \$8 for transfers up to \$1,000
 - Agents receive a commission for each transaction
- Funds paid out through pay point network in destination country

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

The Experiment

Sample, Logistics and Timeline

- Participants recruited among customers of 5 Viamericas agents (stores) in DC metro area
 - Recruitment occurred December 2012 - April 2013
- Approached after sending a remittance, and screened on:
 - Born in Guatemala or El Salvador
 - Sent remittance through Viamericas
 - Sent remittance to their primary remittance recipient
- Received \$5 store credit for participation

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universidad Francisco Marroquín

The Experiment

Recruiting Locations

Project staff posted at agent locations, mainly during high traffic times and days of week

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universidad Francisco Marroquín

The Experiment

Recruiting Locations

Interior of two Viamericas agents locations

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Politècnica de Catalunya

The Experiment

Sample, Logistics and Timeline

- After consent, short baseline survey administered
- Baseline followed by randomized treatment
 - Individual randomization, stratified within groups of 32 consecutively-administered surveys
 - 2x2 design with two randomly assigned treatment variables: price discount and education information
- Phone endline survey 10 weeks later
 - Implemented promptly after intervention (when discount expired): median lag of 2 days
 - Designed to capture remittance behavior during discount period

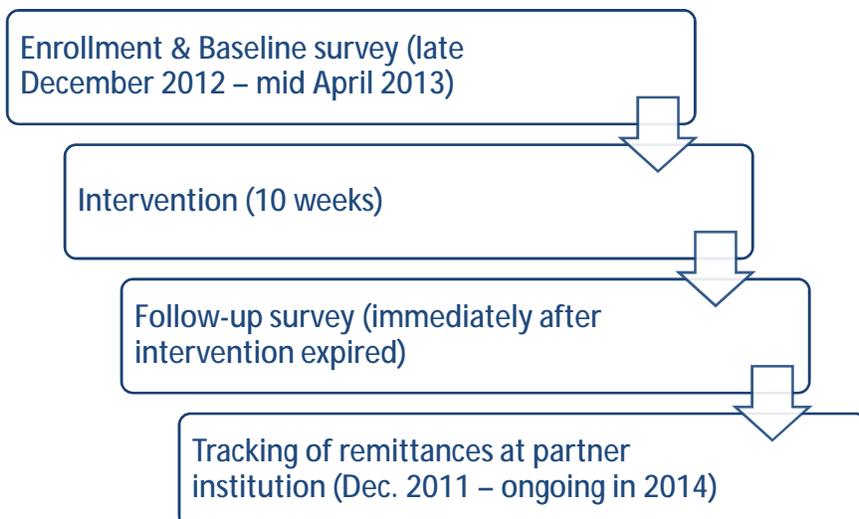

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Politècnica de Catalunya

Fieldwork

Surveys and treatments conducted on the spot, in recruiting locations

Project Timeline

The Experiment

Randomized Treatments

- Price discount
 - Discount of \$3.01 off remittance fee, valid for 10 weeks
 - For remittances sent to primary remittance recipient (PRR) at that agent location
 - Migrants receive a card with names and expiration date written on it
- Education information
 - Part of study on education and remittances in Central America
 - Migrants received an information sheet entitled “Why should I send remittances for education?”
 - Described earnings differentials in home country for different schooling levels

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

The Experiment

Education Information Treatments

- Migrants in treatment group received informational sheet entitled “Why should I send remittances for education?”
- The content focused on the low rates of secondary and tertiary school completion in home country and described the earnings differentials between those who had completed primary, secondary and tertiary schooling.
 - Separate sheets were created for Guatemala and El Salvador.
 - The surveyor went over the information in the sheet with the migrant and the migrant was given the flyer to take home.

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

The Experiment

Experimental Design

	<i>No education information</i>	<i>Education information</i>	
<i>No discount</i>	N = 232	N = 230	N = 462
<i>Discount</i>	N = 247	N = 232	N = 479
	N = 479	N = 462	

Individual randomization, stratified within groups of 32 consecutively-administered surveys
Effectively yields stratification by agent location and time

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universidad Francisco Marroquín

The Experiment

Experimental Protocols

1. Sample: Participants enrolled in Viamericas agent locations
 - Must have from Guatemala or El Salvador
 - Must have remitted to someone using Viamericas
 - Must have remitted to person whom they considered the primary remittance recipient
2. Enrollment after short baseline survey
 - Baseline collected basic demographic and remittance information

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universidad Francisco Marroquín

Experimental Protocols

3. Discounted fee randomly assigned
 - \$3.01 discount (from \$8.00 baseline price)
 - Cross-randomized with an intervention on returns to education information
 - Stratification on agent location (in groups of 32 surveys)
4. Discounted fee period (10-weeks)
5. End-line survey
 - Designed to capture remittance behavior during discount period
 - Completed ASAP after discount period had expired (median lag of 2 days)
 - 71% completion rate

Data Sources

- Survey Data
 - Baseline and follow up surveys
 - Demographic information
 - Self reported remittances, via Viamericas and other companies
- Administrative transaction data
 - All transactions sent through Viamericas to all recipients
 - 12 months prior, 10 week study period, 12 months after
 - Includes amount, date, fee, discount, and recipient
 - Not subject to measurement error common with self reported data

Main Estimation Strategy

For migrant i in stratification cell j , OLS reg of outcome Y :

$$Y_{ij} = \beta_0 + \beta_1 T_{4ij} + \beta_2 T_{3ij} + \beta_3 T_{2ij} + \delta_j + \varepsilon_{ij}$$

- Outcome variables of interest (Y_{ij}): Discounts, # of remittance transactions, transaction amounts
 - Remittance amounts in dollars as well as inverse hyperbolic sine transformation (IHST)
 - IHST of $y = \log(y+(y^2+1)^{1/2})$
- T_i = Treatment indicator

Threats to Identification

- Migrants may switch to Viamericas from other companies
 - Limit participation to existing Viamericas customers
 - Survey questions on use of other companies
- Migrants may intertemporally substitute remittances to take advantage of time-limited discount
 - Examine offsetting responses in post-discount period
- May use PRR as a “channel” to send remittances for other migrants and/or to other recipients
 - Survey questions on sending behavior

Results

Results

Number vs. Amount per Transaction

- Are migrants sending remittances more frequently, but in smaller amounts?
- Answer: No.
 - Impacts on mean transaction amount are not statistically significant, and coeffs mostly not large.
- Implication: Total money amount remittances may have risen

Universitat Pompeu Fabra

Results

Lower Impact of Treatment 4

- Impact of Discount + Information (D+I) consistently lower in magnitude than that of discount alone
- Could be due to “decoy effect” of the Information treatment
 - Ashraf, Aycinena, Martinez and Yang (forthcoming) find a decoy effect in an experiment on migrant control over home-country savings
- Encouragement to remit for education could have made migrants concerned about proper use of their remittances and thus reduced the impact of the discount

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

Results

Additional Analysis

- Endline survey data helps rule out alternative explanations
- Discounts do not induce switching from other remittance companies to Viamericas
 - Sensible, since study participants selected on basis of being Viamericas customers at outset

Additional Analysis

- Endline survey data helps rule out alternative explanations
- Discounts do not induce switching from other remittance companies to Viamericas
 - Sensible, since study participants selected on basis of being Viamericas customers at outset
- Discounts do not induce migrants to use PRRs as “channels” for remittances
 - Either from other migrants
 - Or to other recipients

Increase due to sending for others?

	Have you asked PRR to distribute remittances within their household?	Have you asked PRR to distribute remittances outside their household?	Has someone within your household (not you) sent a remittance to PRR?	Has anyone outside of your household sent a remittance to PRR?	Have you sent remittances to others so that they will distribute them to PRR?	Has anyone given you money to send to PRR?	Has anyone given you money to send to PRR so that they distribute it to other people?

Results

Persistence due to Mistakes?

- Are persistent impacts due to migrants not realizing discount has expired?
- Unlikely: follow-up survey (with 72% success rate) was conducted right after expiration and included questions alerting respondents to expiration
- Hard for mistakes to explain magnitude of post-expiration effect (nearly as large as discount period effect)
 - Or its duration (twice as long as discount period effect)

Universitat Pompeu Fabra

Results

Persistency due to Prospect Theory?

- Model that incorporates recipient's loss aversion, reference dependence
 - Tversky and Kahneman (1991), Masatlioglu and Ok (2014)
- During discount period, migrant raises remittances, intending to reduce once discount expires
 - However, migrant does not fully anticipate shift in recipient's reference point for remittances
- Recipient now expects to receive the higher level of remittances
 - Recipient can enforce this through pressure/punishment ability used to enforce remittance agreements

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

Results

Implications of Behavioral Explanation

- Temporary remittance price reductions could be an effective means of stimulating remittances in the short-term
 - E.g., in response to negative shocks
- The findings may not be revealing about impact of *permanent* reductions
 - Temporary reductions may have such large impacts precisely *because* they are temporary
 - Migrants naively intend to intertemporally substitute, but find that they can't reduce remittances later so quickly
 - With permanent reductions, no intention to intertemporally substitute

Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

Results

Summary of Results

- Reductions in remittance fees lead to: 1) increased frequency of remittances, and 2) increases in *total amount remitted*
- \$3.01 reduction in (\$8) fee leads to:
 - Increase of 16% in remittance transactions
 - No change in amount remitted per transaction
- No evidence of reductions in remittances sent via other channels or of inter-temporal shifts
 - In any case, we observe persistence effects during weeks that follow

Centre
Vernon Smith
ECONOMIA EXPERIMENTAL
Universitat Pompeu Fabra

Summary of Results

- Reductions in remittance fees lead to: 1) increased frequency of remittances, and 2) increases in *total amount remitted*
 - Results suggest behavioral factors may be at play
- Still much to learn about the micro-economic decisions behind remittances flows
 - Why do migrants choose frequent small payments over large, infrequent payments?
 - Are there self-control issues at play for migrants?
 - Are there recipient self-control problems that migrants anticipate?
